                                                                                                                                                                                                                                                                                                                                                                                             VNRIELKGIDFKEDGNILGHKLEYNYNSHNVYIMADKQKNGIKVNFKIRHNIEDGSVQLA 180
                                                                                                                                   The invention relates to a gene encoding proteins having cyan-green fluorescence characteristic and having a function of showing stable fluorescence characteristic in acid region. A method for the preparation of a cyan-green fluorescent protein is provided which involves a transformant transformed by a recombinant vector comprising the gene, where the transformed by a recombinant vector comprising the gene, culture. The present sequence represents the A. victoria green fluorescent protein (EGFP)

The invention describes methods of automated detection, classification
and identification comprising treating cells containing luminescent
creporter molecules (I) in array of locations with a test substance, where
(I) are detectors, classifiers or identifiers, imaging cells in each
location to obtain luminescent signals and converting optical information
into digital data to interpret presence of toxins in the test substance.
The method are useful for detection of toxins in the test substance.
Three classes of cell-based luminescent reporter molecules such as
reporters of toxic threat agents. The first two levels of
characterisation ensure a rapid readout of toxin class without
carrier maintain or dissect
characterisation ensure a rapid readout of toxin class without
several complex mixtures of known toxins. This is the amino acid sequence
of a protease biosensor related signal sequence used in the cell-based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 LVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

The invention relates to a method for mutagenesis that comprises synthesising a mutated strand and a complementary strand by use of synthesising a mutated strand and a complementary strand by use of complemers. The method basically comprises a DNA synthesis in which one or more primers that have a nucleotide sequence containing at least one mutation and a phosphorylated 5'-terminus are annealed to a template DNA and then subjected to an elongation reaction using a thermostable bNA ligase the elongated terminus are ligated by means of a thermostable DNA ligase the step of DNA synthesis is repeated several times to amplify the DNA containing the primers and them, a least DNAs other than the amplified circular DNA are digested into several fragments; and a double-stranded circular DNA are digested into several fragments; and a double-stranded circular DNA synthesis in which, with the several fragments obtained in the step of digestion as megaprimers, the megaparimers are annealed to the circular DNA synthesis and which by an elongation reaction performed using the thermostable high-fidelity DNA polymerase. The method is useful for mutagenesis, particularly for introducing cratain mutations at certain sites of the nucleotide sequence. The present method is simple, speedy, economical and widely applicable. The present method is simple, speedy, economical and widely applicable. The present method is simple, a Aequorea victoria enhanced green fluorescent protein (GFP) used for withering the green fluorescent protein (GFP) sequence of Aequorea
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Method for mutagenesis, e.g. for introducing certain or random mutations at certain sites of the nucleotide sequence, comprises synthesizing a mutated strand and a complementary strand by use of megaprimers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9

comprising a phosphorylation polypeptide and a fluorescent protein or in operative linkage, a donor molecule, a phosphorylatable domain, a phosphorylation domain (PAABD) and an acceptor molecule. The phosphorylation indicators of the invention are useful for detecting kinases or phosphatases in a biological sample. They are also useful in this throughput analysis e.g. for detecting a kinase inhibitor or phosphatase inhibitor. The present sequence is Aequorea victoria enhanced green fluorescent protein (EGFP) used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 LVTTLTYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

Factor No. 613013

GENERAL INFORMATION:
APPLICANT: Kain, Steve
APPLICANT: Li, Xianqiang
TITLE OF INVENTION: Rapidly Degrading GFP-Fusion Proteins and Methods
TITLE OF INVENTION: of Use
FILE REFERENCE: D6100
CURRENT APPLICATION NUMBER: US/09/062,102
CURRENT FILING DATE: 1998-04-17
EARLIER APPLICATION NUMBER: US 60/060,855
EARLIER FILING DATE: 1997-10-02
NUMBER FILING DATE: 1997-10-02

Patent No. 6150176

GENERAL INFORMATION:
APPLICANT: Miyawaki, Ataushi
APPLICANT: Miyawaki, Ataushi
APPLICANT: Llopis, Juan
APPLICANT: Llopis, Juan
APPLICANT: Remington, S. James
ITTLE OF INVENTION: FLUORESCENT PROTEIN SENSORS FOR
ITTLE OF INVENTION: MEAGURING THE PH OF A BIOLOGICAL SAMPLE
FILE REFERENCE: 07257/071001
CURRENT APPLICATION NUMBER: US/09/172,063
CURRENT FILING DATE: 1998-10-13
BARLIER APPLICATION NUMBER: 09/094,359
BARLIER FILING DATE: 1998-06-09
NUMBER OF SEQ ID NOS: 38
SOFTWARE FEASTSEQ for Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

Patent No. 6191269
GENERAL INFORMATION:
APPLICANT: Pollock, Allan
APPLICANT: Lovett, David H.
APPLICANT: Truck, Johanna
TITLE OF INVENTION: Malignant Cancer Cells by Delivery of N.Terminal
TITLE OF INVENTION: Interleukin-1-Alpha Pro-Piece Polypeptide
NUMBER OF SEQUENCES: 30
CORRESPONDENCE ADDRESS:

RAY "Structural and spectral response of green fluorescent protein

ratiants to changes in PH.";

ratiants to changes in PH.";

ratiants to changes in PH.";

LISTINGTION: Energy-transfer acceptor. Its role is to transduce the blochemiluminescence of the protein aequorin into green

fluorescent light by energy transfer. Fluorescence in vivo upon receiving energy from the Ca(2+)-activated photoprotein aequorin.

CC Absorbs light maximally at 395 nm and exhibits a smaller absorbance peak at 470 nm. The fluorescence emission spectrum

CC ABBOATH NORMORE.

CI TISSUE SPECIFICITY: Photocytes.

CI CONTINUE SPECIFICITY: Photocytes.

Aminoacy1-tRNA synthetase; Protein biosynthesis; Ligase, ATP-binding;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 50 TTGKLPVPWPTLVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKD-----
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -i - CATALYTIC ACTIVITY: ATP + L-leucine + tRNA(Leu) = AMP +
diphosphate + L-leucyl-tRNA(Leu).
-i - SUBUNIT: Monomer (By similarity).
-i - SUBCELLULAR LOCATION: Cytoplasmic.
-i - SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SEQUENCE FROM N.A.

-1- SUBCELLULAR LOCATION: Nuclear.
-1- DOMAIN: THE DNA POLYMERASE ACTIVITY DOMAIN RESIDES IN THE N-TERMINAL HALF OF THE PROTEIN, WHILE THE C-TERMINUS IS NECESSARY FOR COMPLEXING SUBUNITS B AND C.
-1- MISCELLANEOUS: In eukaryotes there are five DNA polymerases:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           6.9%; Score 87.5; DB 1; Length 2222;

DNA Res. 8:85-95(2001).
-!- FUNCTION: Converts acetate to acetyl-CoA so that it can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -!- CAUTION: Ref.1 (CABB1884) sequence differs from that shown due erroneous gene model prediction.
-!- CAUTION: Ref.3 sequence differs from that shown due to a frameshift in position 250 and numerous sequencing errors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ACETYL-COENZYME A SYNTHETASE 2-LIKE.

Bacteriol. 185:1018-1026(2003).
-!- CATALYTIC ACTIVITY: ATP + L-leucine + tRNA(Leu) = AMP +
diphosphate + L-leucyl-tRNA(Leu).
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               10-OCT-2003 (Rel. 42, Created)

MITTE C. elegans vitellogenin genes: short sequence repeats in the promoter regions and homology to the vertebrate genes.";
MITTE C. elegans vitellogenin genes: short sequence repeats in the promoter regions and homology to the vertebrate genes.";
MITTE C. elegans vitellogenin genes: short sequence repeats in the nutrients during embryonic development (Potential).

C. elegans vitellogenin secreted.

TISSUE SPECIFICITY: Synthesized in Caenorhabditis only by 32 cells building the intestine of adult hermaphroditic individuals; they are cortranslationally secreted into the body cavity and subsequently taken up by the gonad.

C. elegans vitellogenin secreted.

SEQUENCE OF TISSUE SPECIFICITY Synthesized in the body cavity and subsequently taken up by the gonad.

C. elegans vitellogenin secreted.

SEQUENCE OF TISSUE SPECIFICITY Secreted into the body cavity and subsequently taken up by the gonad.
